

# Architectural Specification: Constitutional Trust Split

**Project:** SnapKitty OS / MOC Core  
**Version:** 1.0.0-council  
**Status:** Formalized Specification

## Overview

This specification defines the constitutional division between compile-time syntactic generation and runtime sovereign authority within the Multiplicity Operator Calculus (MOC) Core.

## Constitutional Trust Split Matrix

| Compile-Time (Macroexpansion)  | Runtime (ACE Governance)        |
|--------------------------------|---------------------------------|
| Structural Transformation      | Immunological Enforcement       |
| Canonical Form Validation      | Sovereign Authorization         |
| Surface Lisp → Canonical MOC   | Registry-State Verification     |
| Syntactic Admissibility Checks | ACE Authority Checks            |
| Mathematical Bound Validation  | WORM Integrity Enforcement      |
| Candidate Transition Emission  | Acceptance / Rejection Decision |
| No Execution Authority         | Final Execution Authority       |

## Implementation Notes

**Trust Split:** Macros serve as the syntactic filter while ACE serves as sovereign authority.  
**Normalization:** All macro expansions resolve to canonical MOC form.  
**Assurance Model:** Compilation is structural; runtime is authoritative.  
**Security Posture:** Syntactic validity alone never grants execution authority.

## Constitutional Principle

Structure proposes. Authority disposes.
